Neutron matter can be modeled as a periodic system of N neutrons interacting by a **Hamiltonian** of the form:

$$H = -\frac{\hbar^2}{2m} \sum_i \nabla_i^2 + \sum_{i<j} v_{ij} + \sum_{i<j<k} V_{ijk} + \dots .$$

In our calculations we used two kinds of potentials:

- **phenomenological** AV8'+UIX.
- **chiral EFT** N2LO local (D2,E1 and with $R_0=R_3N=1.0$ fm) [Lynn et al. PRL 116, 062501 (2016)].

EoS computed by Auxiliary Field Diffusion Monte Carlo (AFDMC).

Conclusions

The interaction part of the EDF is assumed to be of the form:

$$\epsilon_V(\rho, \xi) = \epsilon_0(\rho) + \xi^2 [\epsilon_1(\rho) - \epsilon_0(\rho)] ,$$

where:

$$\epsilon_q(\rho) = \epsilon_q^0 + a_q(\rho - \rho_0) + b_q(\rho - \rho_0)^2 + c_q(\rho - \rho_0)^3$$

where $q=0,1$ (spin polarization). The saturation density is *assumed* to be $\rho_0 = 0.16 \text{ fm}^{-3}$.

This parametrization reproduces very well the AFDMC calculations in a wide range of density ρ (from $\rho_0/2$ to $3\rho_0$) and for both $\xi = 0, 1$.

Conclusions

We are interested in studying the **density response** of the system. For nucleons the response can be splitted in different channels, described by the following operators:

$$O_F = \sum_i O_F(i) = \sum_i \tau_i^\pm e^{i\mathbf{q}\cdot\mathbf{r}_i} \text{ "Fermi"}$$

$$O_{GT} = g_A \sum_i \mathbf{O}(i) = \sum_i \sigma_i \tau_i^\pm e^{i\mathbf{q}\cdot\mathbf{r}_i} \text{ "Gamow-Teller"}$$

$$O_{NV} = \sum_i O_{NV}(i) \text{ "Neutral-vector"}$$

$$= \sum_i \left[-\sin^2 \theta_W + \frac{1}{2}(1 - 2\sin^2 \theta_W)\tau_i^z \right] e^{i\mathbf{q}\cdot\mathbf{r}_i}$$

$$O_{NA} = g_A \sum_i \mathbf{O}_{NA}(i) = g_A \sum_i \frac{1}{2}\tau_i^z \sigma_i e^{i\mathbf{q}\cdot\mathbf{r}_i} \text{ "Neutral-axial-vector"}$$

Weinberg-Salam model

The relation between **weak scattering processes** and **nuclear density response** descends from the *Weinberg-Salam Lagrangian* coupling a nucleon of mass m with neutrinos through weak currents.

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

The WS Lagrangian couples neutrinos to *density* and *spin density* fluctuations of neutrons.

In the **non-relativistic limit** the baryonic current can be approximated by:

$$\bar{\psi}_n(x)\gamma^\mu(1 - C_A\gamma_5)\psi_n \sim \psi_n^\dagger(x)\psi_n(x)\delta_0^\mu - C_A\psi_n^\dagger(x)\sigma_i\psi_n(x)\delta_i^\mu.$$

We have two contributions: **density fluctuations**, and **spin-density** fluctuations.

The scattering rate from a system of neutrons of a neutrino with 4-momentum $q^\mu \equiv (q^0, \vec{q})$ can be computed from the Fermi golden rule, averaging on the initial (neutron and/or proton) states and summing over all the final states.

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

The result gives the *neutrino scattering rate*. For a neutrino of incident energy E , the contribution to the scattering rate σ in a given channel can be written as:

$$\sigma = \frac{G^2}{2} \frac{1}{E} \int dq \int d\omega (E - \omega) q \left(1 + \frac{E^2 + (E - \omega)^2 - q^2}{2E(E - \omega)} \right) S(q, \omega),$$

where $S(q, \omega)$ is the *dynamical structure factor (DSF)* for the excitation operators describing the process. These in turn can be written as a combination of the DSF relative to *density*, and *spin-density* excitations.

Conclusions

We use the **Time Dependent Local Spin Density Approximation (TDLSDA)** approach to compute the response function and the DSF.

We have worked out the response function in the **transverse** and **longitudinal** spin channels.

Following the *Kohn-Sham* method, we introduce a **Local Spin Density Approximation (LSDA)** for the homogeneous neutron matter defining the energy density functional as:

$$E(\rho, \xi) = T_0(\rho, \xi) + \int \epsilon_V(\rho, \xi) \rho \, d\mathbf{r},$$

and we applied the Hohenberg-Kohn theorem which provides a *variational principle on the energy-density functional*.

Numerical
results

Conclusions

For the longitudinal channel we can write the expression for $\chi^{n\uparrow}$ and $\chi^{n\downarrow}$, in terms χ_0 (longitudinal response function of the free Fermi gas). Summing and subtracting $\chi^{n\uparrow}$ and $\chi^{n\downarrow}$ we obtain the density-density (χ_s) and vector-density/vector-density (χ_v) response functions **for arbitrary spin polarization**.

A similar derivation can be done for the transverse channel. The LSDA-KS equations in the transverse channel include an **effective vector potential** accounting for the equilibrium spin polarization and one gets the response function χ_t in terms of the transverse response of the free Fermi gas $\chi_t^0(q, \omega)$.

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

- From the response function it is possible to determine the **dynamic structure factor** via the relation:

$$S^{s,v}(q, \omega) = -\frac{1}{\pi} \Im m[\chi^{s,v}]$$

- From the DSF it is also possible to compute the **energy weighted sum rules**:

$$m_k^{s,v} = \int_0^\infty d\omega \omega^k S^{s,v}(q, \omega) = \sum_n \omega_{no}^k |\langle 0 | F^{s,v} | n \rangle|^2$$

In particular the ratio m_{-1}/m_0 gives the *compressibility* of the system.

- The poles of $\chi(q, \omega)$ give the spectrum and the dispersion $\omega(q)$ of the **collective excitations**, for which we can also evaluate the **strength**.

Conclusions

Neutrino mean free path

As previously discussed, the **scattering rate** of neutrinos can be obtained by computing the integral:

$$\sigma = \frac{G^2}{2} \frac{1}{E} \int dq \int d\omega (E - \omega) q \left(1 + \frac{E^2 + (E - \omega)^2 - q^2}{2E(E - \omega)} \right) S(q, \omega)$$

The **neutrino mean free path** λ is related to σ by the following relation:

$$\lambda = \frac{1}{\sigma \rho}$$

The integration has to be performed on the values of momentum kinematically accessible to neutrinos (**kinematic limits**).

results

Conclusions

- We computed the response function in the longitudinal and transverse channel in pure neutron matter, starting from accurate QMC calculations of (spin polarized) neutron matter.
- The time dependent local density approximation was successfully applied to estimate the response function of arbitrary spin polarized neutron matter.
- We computed the contribution of transverse channel to the suppression of the neutrino mean free path in neutron matter (longitudinal channels is in progress). At the NS core conditions matter is essentially transparent, while relevant effects could be seen in the NS crust.
